1062/C39

AMENDMENTS

Amendments to the Claims

Please amend claims 1, 8-10, 13 and 14, as below, and cancel claim 7:

- 1. (currently amended) An endarterectomy surgical instrument comprising:
 - (a) a shaft having proximal and distal ends;
 - (b) a head coupled to the distal end of the shaft, the head having an endoscope port and at least one fluid port; and
 - (c) a handle coupled to the proximal end of the shaft, the handle comprising:
 - (i) a gas supply port in fluid communication with the at least one fluid port on the head;
 - (ii) a flow valve for metering flow of gas between the gas supply port and the at least one fluid port on the head; and
 - [d] (iii) a locking mechanism for retaining an endoscope; and
 - (d) a grasping device for removing blockage from a blood vessel, the device having a retracted configuration and a deployed configuration wherein the grasping device extends away from the head in the deployed configuration.
- (original) The endarterectomy surgical instrument of claim 1, further comprising a
 saline solution inlet coupled to the handle for coupling a flow of saline solution to the
 at least one fluid port on the head.
- 3. (original) The endarterectomy surgical instrument of claim 1, wherein a fluid connection of the handle to the head of the shaft is provided through a first lumen.

1062/C39

- 4. (original) The endarterectomy surgical instrument of claim 1, further comprising an endoscope for providing optical coupling through a second lumen between the distal and proximal ends of the shaft.
- 5. (original) The endarterectomy surgical instrument of claim 1, wherein a fluid connection of the handle to the head of the shaft is provided through a first lumen, further comprising an endoscope for providing optical coupling through a second lumen between the distal and proximal ends of the shaft.
- 6. (original) The endarterectomy surgical instrument of claim 5, wherein the first lumen is identical to the second lumen.
- Cancelled.
- 8. (currently amended) The endarterectomy surgical instrument of claim [7] 1, further comprising a deployment control disposed on the handle of the instrument and in mechanical communication with the grasping device.
- 9. (currently amended) The endarterectomy surgical instrument as in claim [7] 1 and 8, wherein the grasping device is a barb.
- 10. (currently amended) The endarterectomy surgical instrument as in claim [7] 1 and 8, wherein the grasping device is a hook.
- (original) The endarterectomy surgical instrument as in claim 8, wherein the deployment control is a slide.
- 12. (original) The endarterectomy surgical instrument of claim 8, wherein mechanical communication between the deployment control and the grasping device includes a control wire having a first wire end and a second wire end, the first wire end

1062/C39

connected to the grasping device and the second wire end connected to the deployment control.

- 13. (currently amended) An endarterectomy surgical instrument comprising:
 - (a) a shaft having proximal and distal ends;
 - (b) a head coupled to the distal end of the shaft, the head having an endoscope port and at least one fluid port;
 - (c) a handle coupled to the proximal end of the shaft, the handle comprising:
 - i. a fluid supply port in fluid communication with the at least one fluid port on the head; and
 - ii. a locking mechanism for retaining an endoscope; and
 - (d) a grasping device <u>for removing blockage from a blood vessel</u>, the device having a retracted configuration and a deployed configuration wherein the grasping device extends away from the head in the deployed configuration.
- 14. (currently amended) A method for performing endarterectomy for removing an obstruction from a blood vessel, the method comprising:
 - (a) inserting the endarterectomy surgical instrument of claim 1 through a single incision in the blood vessel;
 - (b) providing fluid through the at least one fluid port of the head for separating intima and media layers <u>from the adventitia layer</u> of the [artery] <u>blood vessel</u> surrounding the blockage;
 - (c) grasping the blockage with a grasping device at the distal end of the endarterectomy instrument; and
 - (d) removing the blockage through the incision.
